

Brent Farrell, DPT

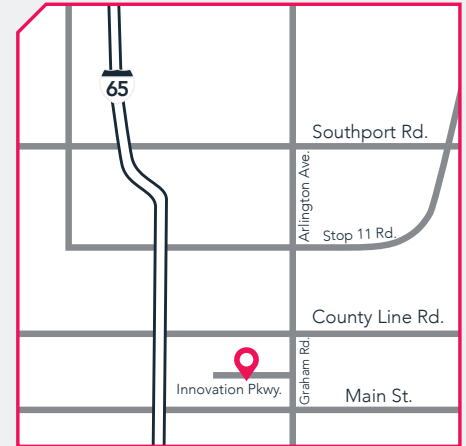

Physical Therapist

Brent Farrell is an inpatient physical therapist who helps patients navigate the earliest stages of recovery following surgery. Most of the patients he works with are just 24 to 48 hours post-operative – typically after hip or knee replacement, spine, shoulder, or foot and ankle procedures. During this early phase of recovery, Brent teaches patients how to safely move, including how to walk with an assisted device and what movements to avoid as they begin healing.

Brent is especially focused on preparing patients for the transition home. He takes time to listen to their concerns and address their questions, such as how to get in and out of bed or manage stairs. By the end of their sessions, his goal is for every patient to feel more confident in their ability to complete their daily activities.

Brent was drawn to physical therapy by a desire to help people move better and improve their quality of life. A clinical rotation working with total joint patients, both before and after surgery, ultimately led him to pursue inpatient care. He earned his bachelor's degree in exercise science from Ball State University and his Doctor of Physical Therapy from Indiana University. He has also completed the Medbridge Total Joint Replacement Certificate program.
